

The Eukaryotic Cell Cycle

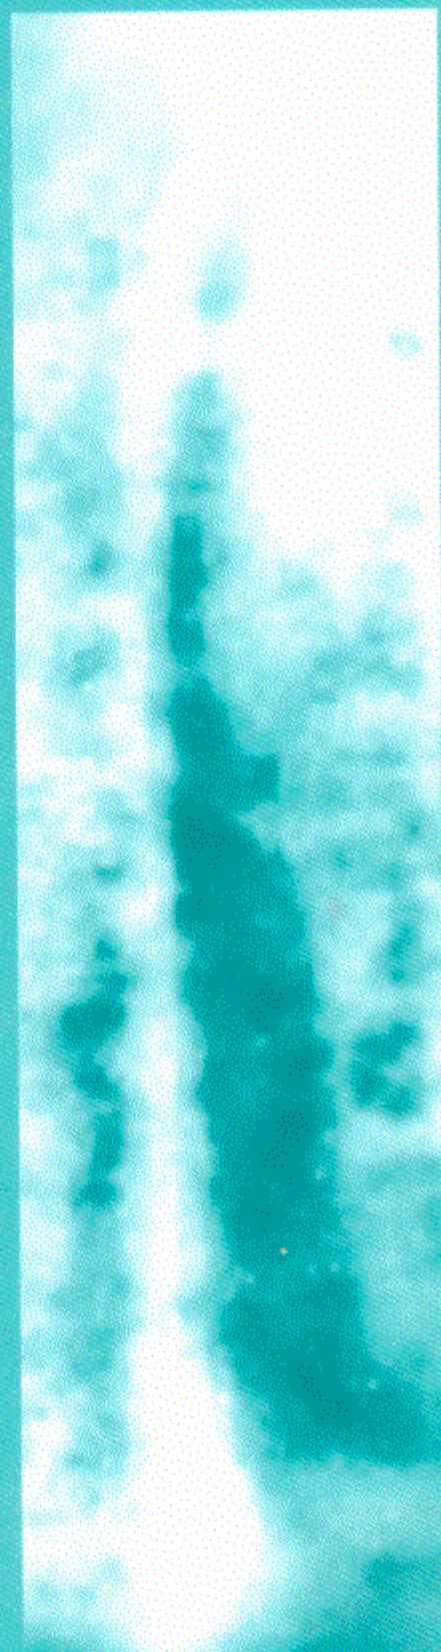

Edited by
John A Bryant & Dennis Francis

The Eukaryotic Cell Cycle provides an overview of the stages of the eukaryotic cell cycle, concentrating specifically on cell division for development and maintenance of the human body. It focuses especially on regulatory mechanisms and in some instances on the consequences of malfunction.

Written by respected researchers, *The Eukaryotic Cell Cycle* provides both graduate and postdoctoral researchers with an excellent account of important experiments, research, organisms of interest and findings connected to each stage of the cycle and the components involved in these.
