

The future

When a newborn baby grows up

When the offspring of all living things—plant, animal and human—live after thousands of years

Hope that all can live happily

With pure blue sky

With crystal-clear water

With fresh air

What can scientists do to secure this future?

How can scientists utilize natural resources, biocatalysts, in humankind's activities?

Here, the prospects and dreams that can come to fruition by using biocatalysis are explored. I hope to contribute to conserving and restoring the natural environment by showing the power of enzymes, a treasure from Mother Nature, to catalyze reactions for humankind.
