

## 纪念达尔文诞辰200周年 国际学术会议论文集

An excellent summary of the Darwin 200 Beijing International Conference that covers a wide range of evolutionary studies, from fossil records to molecular analyses, as well as the development of evolutionary theories. The Conference abstracts of oral presentations and photos taken during the conference provide a vivid picture of the Conference attended by over 500 participants.

— De-Yuan Hong, *Institute of Botany, Chinese Academy of Sciences, China*

*Darwin's Heritage Today* contributes to the long chain of reasoning and discussion that was initiated by the publication of *On the Origin of Species* and has placed Darwin's Theory of Evolution as the inevitable foundation of current biological thinking. The book brings together important syntheses and new aspects of evolutionary theory and takes readers through the great biodiversification events of the ancient past, bridging some of the gaps in the fossil record that so concerned Darwin. The book is broad in its approach, well written and has a beautiful layout that invites exciting reading in a quiet corner.

— Else Marie Friis, *Swedish Museum of Natural History, Sweden*
