

"Erling Norrby shows that serendipitous events, reorienting the pathway of science, often occur through the actions of dedicated individuals with unique cultural backgrounds, an original sense of values, and firm principles. Norrby's experience highlights the significant challenges committee members face in wisely selecting Nobel Prize winners, challenges of which the recipients, myself included, are largely unaware."

Ryoji Noyori, *Nobel Laureate
in Chemistry 2001*

"The rich and incisive content of Norrby's book illustrates how the Nobel Prize rewards new discovery, the products of exploration beyond the edge of the known and safe and into the vast spaces of the unknown and mysterious ... Awardees often have broad interests beyond their specialty that ornaments their imagination and allows them to see order and value in the seeming chaos of the natural world."

Baruch S. Blumberg, *Nobel Laureate
in Physiology or Medicine 1976*

"This book provides a fascinating account of Nobel Prizes in the life sciences. As a virologist, the author expertly covered the background of significant early developments of this field and simultaneously discussed this in relation to more recent developments. I congratulate the author and trust that this documentation will find the interest which it so well deserves."

Harald zur Hausen, *Nobel Laureate
in Physiology or Medicine 2008*
