TAXONOMY OF ANGIOSPERMS

V N Naik

Presents an up-to-date account of the general principles and modern trends in the taxonomy of angiosperms. The book stresses on the definitions, methodology and concepts of taxonomy and presents the subject in a lucid and systematic manner.

Some of the attractive features of the book are:

- Clearly brings out the aims and principles of taxonomy
- Compares all current systems of classification
- Explains intricate rules of plant nomenclature clearly
- Includes a chapter on phytogeography
- Gives an understanding of the hierarchical arrangement of plant groups
- Consolidates the various theories on the origin of angiosperms
- provides up-to-date information on important herbaria and botanical gardens of the world

The book is well illustrated and is a comprehensive and dependable text for undergraduate and postgraduate students of botany.

TEXTBOOK OF VERTEBRATE EMBRYOLOGY

N N Majumdar

A simple, concise, and easy-to-understand text, this book is specially written for the average Indian student. It describes the development of representative examples from different classes of vertebrates separately. It contains examples of an Amphioxus, a fish, a frog, a bird and a mammal. For mammalian development, the example chosen is the embryological development of the human embryo. The study of individual developments will give the student the necessary background knowledge to understand the comparative account of development which follows later. To aid the student, a comprehensive glossary of embryological terms and a list of further reading are also appended.

With its simple style and systematic coverage, the book will be a highly useful text for undergraduate students of zoology. It will also be a useful reference to medical students.
